

eXtra 10

High Quality Monitoring Headphones with dSONIQ Modeling Software

eXtra 10 headphones are a combination of lightweight, half-closed headphones and a modeling plugin for binaural perception. With the included dSONIQ Realphones ESI Edition, you'll get true studio control room sound with your headphones, no matter where you are.

Optimally adapted

The physical characteristics of the eXtra 10 form the basis for the adaptation of the popular dSONIQ software. Through months of fine-tuning, the ESI Edition has been optimally adapted to the ESI headphones down to the smallest detail. The result is a combination of solid audio hardware and an innovative technology that makes the sound reproduction as reliable and precise as a high-quality monitoring system in the studio.

Finalize your song faster with presets to verify your mix

With Realphones, your eXtra 10 become a reliable monitoring tool for mixing tracks - whether on the road or in the studio. Not only that: a single mouse click is all it takes to make them sound like hifi speakers, like ear pods or like a portable device. Thanks to the software, you can check your final mix without even taking off your headphones.

Designed for long mixing sessions

eXtra 10 headphones are lightweight, providing a clear and accurate reproduction for monitoring purposes in the studio.

Designed to adjust automatically to any head size and outfitted with extra durable and isolated ear pads, you will be surprised how comfortable our eXtra 10s are - especially when used for longer periods. Delivering a wide range with specially selected transducers, you will be able to listen to all the details of your mix across the whole frequency response.

Even with no software used, eXtra 10 headphones offer an amazing quality.

eXtra 10 is available on its own as well as in our U22 XT cosMik Set studio recording bundle.

Features

- combination of headphones and modeling software
- on-the-ear simulation of a recording studio control room

eXtra 10
