What are the U46 series power supply specifications?

original release: 2012-06-18 | ID: KB00075EN

Our U46 series interfaces (U46DJ, U46 SE and U46 XL) can be used with an optional external power supply. This might be needed in case the USB bus power from the host computer is not powerful enough to provide the +48V phantom power of the built-in microphone preamp. For that, the U46 device can be used with an optional standard power supply which is not available from us.

The power supply needs to be regulated and provide **9V DC** with at least **500mA**.

The outside (sleeve) of the connector is -, while the inside (tip) is +. The connector diameter is 5.5mm (= 2.2in).

Such a power supply is a standard part that can be purchased via most music or electronic retailers and mail order companies. If you are unsure, print out this page and show it at your local shop.
