Specifications for the Dr. DAC prime power supply

original release: *2012-06-19* | ID: *KB00082EN*

Dr. DAC prime requires a power supply for stable operation. This power supply is included by default, yet can be replaced with a standard power supply (which is not recommended by us).

The power supply needs to be regulated and provide between **9V** and **12V DC** with at least **1.5 A**. The outside (sleeve) of the connector is **-**, while the inside (tip) is **+**. The connector diameter is 5.5mm (= 2.2in).

Such a power supply is a standard part that can be purchased via most music or electronic retailers and mail order companies. If you are unsure, print out this page and show it at your local shop or contact the local ESI distributor in your country.
