Can I use my Keyboard under Linux?

original release: *2014-08-28* | ID: *KB00184EN*

Our controller keyboards are so-called "Class Compliant" which means that they should work with the the standard USB MIDI driver which is part of most current Linux distributions. In fact, many of our customers are using our controller keyboards under Linux. However, as the driver has not been developed by us and as there are many different variants and possible configurations, we cannot provide technical support for this combination. Please refer to the common online forums and discussion groups regarding audio / MIDI under Linux and ALSA as well as USB MIDI support.
