Can I use Neva OTG under Linux?

original release: *2025-02-26* | ID: *KB00334EN*

Yes! However, please note that although Neva OTG is fully class compliant and many functions can be controlled via the switches on the panel, some functionality regarding the transfer of audio signals to the OTG sub port might be depending on the used applications if you intend to use a connected mobile phone simultaneously. Generally the hardware is supported by the USB audio driver from the ALSA package which is part of most Linux distributions. Please note that the driver has not been developed by us, so we can only provide limited technical support for this.
